PRESENTING CLINICAL SIGNS

Recheck 2 weeks intermittent open mouth breathing nonresponsive to clavamox 2 week course (has not progressed). 1st noted 6 weeks prior. Thoracic radiographs taken at that time and course of clavamox started. Overall still normal behaviors, seems to happen more often in the afternoon. Will playing, have several minute episode of open mouth breathing then go back to playing. Came of the streets of Trenton as a kitten. Had chronic diarrhea as a kitten that was hard to clear up but resolved for 4 months.

RADIOGRAPHIC STUDY OF THE THORAX

BREED

Radiographs of the thorax in two imaging planes are provided for review.

Domestic Short Hair

RADIOGRAPHIC FINDINGS

The surrounding bony structures are within normal limits.

SEX

The extrathoracic soft tissues present homogeneous without abnormalities.

Male Neuter

The heart is of normal size and shape, there is no evidence of cardiac chamber or vascular enlargement. The pulmonary vasculature is within normal limits.

AGE

1 Year

The trachea is normal in diameter and presents the anticipated course. The luminal outline of the trachea is smooth.

INTERPRETED BY

Sebastian Schaub, DVM
Dr. med. vet. DipECVDI

The bronchial tree presents with thin walls and tapers uniformly towards the periphery as expected.

The lung parenchyma presents the expected architecture and opacity; the intrapulmonary vascular branching is seen up to the third order lung vessels.

The diaphragm is well delineated with even surface and the expected mild cranial bulging of the diaphragmatic cupola.

Blandford Animal
Hospital

RADIOGRAPHIC DIAGNOSIS

- Normal thorax

REFERRING VET

Lapierre

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The radiographic study of the thorax presents without abnormalities. To rule out underlying congenital disease of the heart, complementing workup by a cardiac echo might be considered.
