

PATIENT PRESENTING CLINICAL SIGNS

Luna Guzman 3 weeks hx of ptyalism, abd stretching, panting and intmt V/D; no known trigger; historically not food motivated - even less so now. Please comment on possible 2 small bowel populations. Thank you.

SPECIES RADIOGRAPHIC STUDY OF THE ABDOMEN

Canine Radiographs of the abdomen in three imaging planes are provided for review.

RADIOGRAPHIC FINDINGS

BREED The surrounding bony structures are within normal limits.

Samoyed No abnormalities of the extraabdominal soft tissues are noted. The abdominal wall is smooth and thin, but two metal opaque sutures at the mid ventral abdominal wall.

The serosal detail is maintained throughout the peritoneal and retroperitoneal space.

SEX The liver is appropriate in position, size and presents uniform opacity.

Female Spayed The splenic head is in the anticipated position and within normal limits for size and opacity. The splenic body and tail are considered normal for position, size, shape and opacity.

AGE Both kidneys are seen and present with normal size, shape, delineation and opacity. The urinary bladder is in its anticipated position. No radiopaque calculi are noted throughout the upper and lower urinary tract.

2.5 Years

INTERPRETED BY The stomach is in its anticipated position and empty.

The small intestinal loops are segmentally mildly distended by gas.

The colon is seen in the expected position and presents with appropriate content.

HOSPITAL NAME RADIOGRAPHIC DIAGNOSIS

- Empty gastrointestinal tract

DTLAvets

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

REFERRING VET The radiographic study presents without abnormalities, explaining the presenting clinical signs. There is no evidence of radiopaque foreign material, abnormal gas pattern or signs for gastrointestinal mechanical obstruction. There is only mild segmental dilation of the small intestinal loops, which is considered as a dynamic finding, as the gas and dilation is redistributing throughout the consecutive radiographic studies.
