

PATIENT

Franny Rice

PRESENTING CLINICAL SIGNS

History: Bowenoid in situ carcinoma originally diagnosed Feb 2022 and treated with imiquimod topical. Now similar lesions are generalized, and one more ulcerative, proliferative lesion was biopsied. Concern for progression to squamous cell carcinoma. Thoracic radiographs for staging in preparation for oncology referral.

SPECIES

Feline

RADIOGRAPHIC STUDY OF THE THORAX

Radiographs of the thorax in three imaging planes are provided for review.

BREED

DSH

The surrounding bony structures are within normal limits.

SEX

Spayed Female

The extrathoracic soft tissues present homogeneous without abnormalities.

The heart is of normal size and shape, there is no evidence of cardiac chamber or vascular enlargement. The pulmonary vasculature is within normal limits.

AGE

13 Years

The trachea is normal in diameter and presents the anticipated course. The luminal outline of the trachea is smooth.

The bronchial tree presents with thin walls and tapers uniformly towards the periphery as expected.

The lung parenchyma presents the expected architecture and mild generalized ground glass opacification; the intrapulmonary vascular branching is seen up to the third order lung vessels.

The diaphragm is well delineated with even surface and the expected mild cranial bulging of the diaphragmatic cupola.

INTERPRETED BY

Sebastian Schaub,
DVM Dr. med. vet.
DipECVDI

RADIOGRAPHIC DIAGNOSIS

- Normal thorax

HOSPITAL NAME

Northshore VH

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The radiographic study of the thorax is negative for pulmonary metastatic disease, but mild generalized age-related changes of the lung parenchyma, accentuating a mild unstructured interstitial pattern of the lung parenchyma.

REFERRING VET

Sophie Lee, DVM

The information and recommendations provided are based on the images presented by the referring veterinarian/sonographer. No evaluation can be communicated regarding pathology that was not visible in the image/video clips provided.
