

PATIENT

Mya Johnson

PRESENTING CLINICAL SIGNS

Thoracic screening -rads of L rear revealed mass -suspicious of osteosarcoma.

SPECIES

Canine

RADIOGRAPHIC STUDY OF THE THORAX

Radiographs of the thorax in three imaging planes are provided for review.

BREED

Chesapeake Bay
Retriever

RADIOGRAPHIC FINDINGS

The vertebral endplates T4/T5 present mild spondylosis formation.

The extrathoracic soft tissues present homogeneous without abnormalities.

The heart is of normal size and shape, there is no evidence of cardiac chamber or vascular enlargement. The pulmonary vasculature is within normal limits.

The cranial mediastinum presents the expected soft tissue opacity. The mediastinal width is less than twice the width of the vertebral column at the same level.

SEX

SF

The trachea is normal in diameter and presents the anticipated course. The luminal outline of the trachea is smooth.

AGE

9 Years

The bronchial tree presents with thin walls and tapers uniformly towards the periphery as expected.

The lung parenchyma presents the expected architecture and generalized mild to moderate ground glass opacification; the intrapulmonary vascular branching is seen up to the third order lung vessels.

INTERPRETED BY

Sebastian Schaub, DVM
Dr. med. vet. DipECVDI

The diaphragm is well delineated with even surface and the expected mild cranial bulging of the diaphragmatic cupola.

HOSPITAL NAME

Brunswick Veterinary
Hospital

RADIOGRAPHIC DIAGNOSIS

- Generalized mild to moderate unstructured interstitial lung pattern.
- Spondylosis deformans T4/T5

REFERRING VET

Dr. Nicole Lamora

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The radiographic study is negative for pulmonary metastatic disease.

The unstructured interstitial lung pattern is likely a sequela to the nutritional status and age related changes of the lung parenchyma.
