

PATIENT PRESENTING CLINICAL SIGNS

Riley Visger
 Riley started to act very clingy on Wednesday (yesterday) and not acting right. Panting, shaking and can't calm down. He seems like he is in pain or uncomfortable. He didn't sleep in his bed but slept under their bed. Acute on set of anxiety and clinginess. Rapid breathing
SPECIES Abnormal PE/Chem/CBC/UA Results: TONGUE ON / OFF A BIT CYANOTIC. FULL CRANIAL ABDOMEN, VERY TENSE, NOT OVERTLY DISTENDED. TACHYPNIC- PANTING. CBC: Great. Mildly low EOS CHEM: Great. Mild ALP and Lipase elevations UA: Great
 Canine

RADIOGRAPHIC STUDY OF THE THORAX

BREED Radiographs of the thorax in three imaging planes are provided for review.

Beagle **RADIOGRAPHIC FINDINGS**

Multifocal mild spondylosis formation is appreciated along the thoracic spine. The elbow joints present moderate osteophyte new bone formation.

SEX The extrathoracic soft tissues present homogeneous without abnormalities.

MN The heart is of normal size and shape, there is no evidence of cardiac chamber or vascular enlargement. The pulmonary vasculature is within normal limits.

AGE The cranial mediastinum presents the expected soft tissue opacity. The mediastinal width is less than twice the width of the vertebral column at the same level.

13 Years, 10 Months The trachea is normal in diameter and presents the anticipated course. The luminal outline of the trachea is smooth.

INTERPRETED BY Sebastian Schaub, DVM
 Dr. med. vet. DipECVDI The bronchial tree presents with thin walls and tapers uniformly towards the periphery as expected.

HOSPITAL NAME The lung parenchyma presents the expected architecture and opacity; the intrapulmonary vascular branching is seen up to the third order lung vessels.

Elizabeth Animal Hospital The diaphragm is well delineated with even surface and the expected mild cranial bulging of the diaphragmatic cupola.

RADIOGRAPHIC DIAGNOSIS

- Degenerative osteoarthritis elbow joints bilaterally
- Spondylosis deformans

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

INVOICE The radiographic study of the thorax presents without abnormalities, explaining the described clinical signs. If there is evidence of oxygenation disorder, complementing workup by a cardiac echo can be used to check for signs of pulmonary hypertension, that might indicate pulmonary thromboembolism – no specific radiographic changes are appreciated that would support this diagnosis, but will not rule out PTE either.
