

**PATIENT PRESENTING CLINICAL SIGNS**

Dodger Salmirs History: on and off lameness on left hind leg. slight drawer sign on left stifle joint.

RADIOGRAPHIC STUDY OF THE STIFLE JOINTS**SPECIES**

Canine

Radiographs of the stifle joints in two orthogonal imaging planes are provided for review.

RADIOGRAPHIC FINDINGS**BREED**

Border Collie

The periarticular bones of the left stifle joint present mild to moderate osteophyte new bone formation and a moderate intracapsular soft tissue swelling of the left stifle joint is appreciated - distorting the infrapatellar fat-pad cranially and the fascial plane caudally.

SEX

Neutered Male

The periarticular bones of the right stifle joint present early stage of osteophyte formation and a mild intracapsular soft tissue swelling of the right stifle joint is appreciated.

RADIOGRAPHIC DIAGNOSIS**AGE**

8 Years

- Degenerative osteoarthritis stifle joints bilaterally, L>>R
- Articular swelling stifle joints bilaterally, L>>R

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS**INTERPRETED BY**

Sebastian Schaub,
DVM Dr. med. vet.
DipECVDI

The radiographic study is consistent with bilateral chronic degenerative osteoarthritis with concomitant joint effusion of both stifle joints, L>>R. The most-likely underlying cause is (partial) rupture of the cranial cruciate ligament with or without meniscal disease.

A positive drawer sign or tibial compression test under general anesthesia will support the diagnosis – partial rupture of the cranial cruciate ligament and potential thickening of the synovial capsule can result in only mild instability.
