

PATIENT PRESENTING CLINICAL SIGNS

Moose Underwood P is ADR (Aint doing right) fever 105.0 mostly nml blood work with slightly elevated white blood count 18k. x rays were taken to explore symptoms noted above.

SPECIES RADIOGRAPHIC STUDY OF THE ABDOMEN

Canine Radiographs of the abdomen in three imaging planes are provided for review.

RADIOGRAPHIC FINDINGS

BREED The vertebral endplates of the lumbosacral junction present moderate spondylosis formation.
Pit Mix No abnormalities of the extraabdominal soft tissues are noted. The abdominal wall is smooth and thin.
The serosal detail is maintained throughout the peritoneal and retroperitoneal space.

SEX The liver is appropriate in position, size and presents uniform opacity.
M The splenic head is in the anticipated position and within normal limits for size and opacity. The splenic body and tail are considered normal for position, size, shape and opacity.

AGE Both kidneys are seen and present with normal size, shape, delineation and opacity. The urinary bladder is in its anticipated position. No radiopaque calculi are noted throughout the upper and lower urinary tract.

6 Years The stomach is in its anticipated position and empty.

INTERPRETED BY

Sebastian Schaub, DVM
Dr. med. vet. DipECVDI

The small intestinal loops are of even diameter and non-dilated, a small amount of gas is seen within the small intestinal loops and considered within normal limits.

The colon is seen in the expected position and presents with appropriate content.

HOSPITAL NAME

Golden Isles Animal
Hospital

RADIOGRAPHIC DIAGNOSIS

- Spondylosis deformans lumbosacral junction

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

REFERRING VET

James Hornbuckle

The radiographic study of the abdomen presents without clinically relevant abnormalities. An underlying cause for the presenting clinical signs cannot be defined.
