

PATIENT PRESENTING CLINICAL SIGNS

PATIENT Khaos Jacomino 12 yr old neutered pitbull presented for diarrhea and now vomiting. Owner did change his diet the day previous to his symptoms. Pet does eat random things that are not part of his diet. Energy level is still decent.

SPECIES Canine
BREED Pitbull Mix
SEX MN

Abnormal PE/Chem/CBC/UA Results: Hydration: 5% dehydrated Mentation: QAR EENT: No nasal discharge; clear no discharge, nuclear sclerosis OU; clean no exudate AU; No cough on tracheal palpation. Oral Cavity: moderate dental tartar present, periodontal disease grade 3 Lymph Nodes: Symmetrical, no changes in size, shape, consistency Skin: Good hair coat, no signs of ectoparasites. Small <5mm raised, round, dark pigmented hairless dermal growth above left eye CV/Respiratory: No murmur/arrhythmia or crackles/wheezing auscultated. Synchronous pulses, normal rate. Normal bronchovesicular sounds. Abd/GI: Mild tense non painful abdomen, no organomegaly, no abnormalities on abdominal palpation Uro/Perineum: N Musculoskeletal: Normal ambulation, no lameness noted. Adequate musculature. Right stifle moderately thickened. BCS 6/9 Neurological: Appropriate CBC - wnl CHEM - ALKP 369 H (23-212), CHOL 336 H (110-320) cPL - Abnormal Electrolytes - CI 106 L (109-122)

RADIOGRAPHIC STUDY OF THE ABDOMEN

Radiographs of the abdomen in two orthogonal imaging planes are provided for review.

AGE RADIOGRAPHIC FINDINGS

12 Years, 4 Months The vertebral endplates L2/L3 and L7/S1 present moderate spondylosis formation.

INTERPRETED BY Sebastian Schaub, DVM
 Dr. med. vet. DipECVDI

No abnormalities of the extraabdominal soft tissues are noted. The abdominal wall is smooth and thin.

The mesenteric fat presents a mild soft tissue striation.

HOSPITAL NAME The liver is appropriate in position, size and presents uniform opacity.

DPC Veterinary Hospital The splenic head is in the anticipated position and within normal limits for size and opacity. The splenic body and tail are considered normal for position, size, shape and opacity.

REFERRING VET Both kidneys are seen and present with normal size, shape, delineation and opacity. The urinary bladder is in its anticipated position. No radiopaque calculi are noted throughout the upper and lower urinary tract.

Dr. Duke The stomach is in its anticipated position and presents normal content.

INVOICE The small intestinal loops are of even diameter and non-dilated, a small amount of gas is seen within the small intestinal loops and considered within normal limits.

47077 The colon is seen in the expected position and is empty

PATIENT

Khaos Jacomino

RADIOGRAPHIC DIAGNOSIS

- Possible mild peritoneal effusion
- Empty colon
- Spondylosis deformans

SPECIES

Canine

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

There is no evidence of radiopaque foreign material or signs for gastrointestinal mechanical obstruction. The mild soft tissue striation of the mesenteric fat can indicate mild peritoneal effusion – given the clinical signs secondary to gastroenteritis, hypalbuminemia or pancreatitis are the top differentials. If not done so yet, complementing blood work by cpl is recommended.
