

PATIENT PRESENTING CLINICAL SIGNS

Kongyi Jung Left avascular necrosis of the femoral head and neck. Lamé now on the right pelvic limb. Owner notices licking at front right paws.

SPECIES RADIOGRAPHIC STUDY OF THE ELBOW & CARPAL JOINTS, PELVIS AND STIFLE JOINTS

Canine Radiographs of the elbow joints, carpal joints, pelvis and stifle joints in two orthogonal imaging planes are provided for review.

RADIOGRAPHIC FINDINGS

BREED
Poodle
In the mediolateral projection, the elbow joints are mildly pronated, L>R. Both elbow joints have smooth osseous margins of the periarticular bones and the surrounding soft tissue structures present without abnormalities.

The osseous and surrounding soft tissue structures of the carpal joints are within normal limits.

SEX
FS
The left femoral head and neck are absent – history of left sided femoral head ostectomy. The remainder of the osseous and surrounding soft tissue structures of the pelvis are within normal limits. The right coxofemoral joint presents smooth osseous margins and congruent joint space.

AGE
2
The stifle joints have smooth osseous margins and present no sign of intracapsular soft tissue swelling. The patella of both stifle joints is in situ.

RADIOGRAPHIC DIAGNOSIS

INTERPRETED BY

Sebastian Schaub, DVM
Dr. med. vet. DipECVDI

- History of left sided femoral head ostectomy due to avascular necrosis
- Normal elbow joints
- Normal carpal joints
- Normal right coxofemoral joint
- Normal stifle joints

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The radiographic study reveals no abnormalities and an underlying cause for the licking at the front limbs and the right hind limb lameness are not appreciated.
