

PATIENT PRESENTING CLINICAL SIGNS

Charlie Smith Patient was attacked by a housemate and bit on the head. There is a laceration under the chin and swelling all around the muzzle.

SPECIES COMPUTED TOMOGRAPHY OF THE SKULL

Canine A high resolution pre- and post-contrast CT study of the skull is provided for review.

COMPUTED TOMOGRAPHIC FINDINGS

BREED The sutures of the skull are age related visible.

Dachshund The pictured parts of the deciduous teeth and tooth buds are unremarkable in all jaw quadrants. A fissure line is running through the crest of the tooth bud of triadan 103. The crest of the tooth bud of triadan 104 presents a mild irregular fracture line running through the medial wall, without overt displacement.

SEX The nasal cavity presents the expected aerated spaces between thin & even conchae and turbinates with smooth mucosal lining. Along the right dorsal aspect of the nose, a moderate subcutaneous swelling is visible, a small isolated osseous fragment is seen at the most rostral aspect of the right nasal bone.

Male

AGE Age related incomplete ossification of the condylar process of the mandible bilaterally is seen, no abnormalities of the temporomandibular joints are appreciated.

8 Weeks

INTERPRETED BY Both tympanic bullae are aerated, the mucosal lining is not seen, the bony wall is smooth and thin. The external ear canals are within normal limits.

Sebastian Schaub, DVM Dr. med. vet. DipECVDI The brain presents no deviation from normal anatomy and symmetry. The brain parenchyma is homogeneous and within normal limits for attenuation and distribution of contrast enhancement. The ventricular system is non-dilated and symmetric.

HOSPITAL NAME The submandibular and medial retropharyngeal lymph nodes are small and elongated with a normal short-to-long-axis-ratio is < 0.5, the attenuation and contrast enhancement pattern is uniform.

Wilvet Salem

COMPUTED TOMOGRAPHIC DIAGNOSIS

- REFERRING VET**
- Fissure line alveolar bone tooth bud triadan 103 and fractured medial wall of the crest of the tooth bud of triadan 104
 - Small isolated osseous fragment rostral aspect right nasal bone
 - Soft tissue swelling right dorsolateral aspect of the nose

Dr. Craig Seyler DVM

INVOICE INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

53666 The CT study presents without evidence of non-displaced fracture/fissuring of the alveolar crest of triadan 103 & 104 – I would consider this as clinically not relevant, however check if there is normal eruption & growth of the respective permanent teeth.
