

**PATIENT PRESENTING CLINICAL SIGNS**

Puppy Hensley CT on 6/14/22 revealed changes "pathognomonic for fungal rhinitis such as aspergillosis". Treated medically since then. Symptoms are much improved and we are rechecking CT to monitor the disease.

**SPECIES COMPUTED TOMOGRAPHY OF THE SKULL**

Canine A high resolution pre- and post-contrast CT study of the skull in a bone and soft tissue reconstruction is provided for review.

**BREED COMPUTED TOMOGRAPHIC FINDINGS**

Pitbull The pictured parts of the dentition are complete and unremarkable in all jaw quadrants.

**SEX** The nasal cavity presents the expected aerated spaces between thin & even conchae and turbinates with smooth mucosal lining. The right frontal sinus is mildly distorted and presents mild hyperostosis of the osseous lining.

**M** Both temporomandibular joints present congruent joint spaces with even subchondral bone surfaces and are considered within normal limits.

**AGE** Both tympanic bullae are aerated, the mucosal lining is not seen, the bony wall is smooth and thin. The external ear canals are within normal limits.

5 Months The brain presents no deviation from normal anatomy and symmetry. The brain parenchyma is homogeneous and within normal limits for attenuation and distribution of contrast enhancement. The ventricular system is non-dilated and symmetric.

**INTERPRETED BY**

Sebastian Schaub, DVM  
Dr. med. vet. DipECVDI

The left medial retropharyngeal lymph node is prominent.

**COMPUTED TOMOGRAPHIC DIAGNOSIS**

- History of possible mycotic rhinitis
- Lymphadenopathy left medial retropharyngeal lymph node
- Secondary osseous remodeling of the right frontal sinus

**HOSPITAL NAME**

Bluegrass Veterinary Specialists

**INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS**

**REFERRING VET**

Gover

The current CT study presents without signs of active rhinitis or sinusitis and likely due to the age, complete recovery of the nasal conchal & turbinate structures is appreciated.

The odds for reactive hyperplasia of the left medial retropharyngeal lymph node are high, but no underlying cause is appreciated and might present an age related finding. FNA sampling can be considered to confirm the diagnosis.
