

**PATIENT**Rags Raffey
(CASDDA)**PRESENTING CLINICAL SIGNS**

Healthy on PE except for OA. Excessive licking began 3 months ago, left paw worse than the right
Abnormal PE/Chem/CBC/UA Results: LFL - marked bony swelling on 3rd digit at P1-2. and 4th digit at P1-2. mild mod alopecia on dorsal paw, no obvious joint OA. Mild decrease in carpal flexion. RFL - mild mod alopecia on dorsal paw, no obvious joint OA.

SPECIES

Canine

RADIOGRAPHIC STUDY OF THE FRONT PAWS

Radiographs of the front paws in two orthogonal imaging planes.

BREED

Golden Retriever

RADIOGRAPHIC FINDINGS

At the dorsal aspect of the distal third of the third left metacarpal bone, a moderate homogeneous soft tissue swelling is appreciated. At the abaxial aspect of the metaphysis of the left third metacarpal bone, very mild solid periosteal new bone formation is appreciated.

SEX

Female Spayed

No abnormalities of the osseous and soft tissue structures of the right front paw are appreciated, but a small amount of mineral opaque material attached to the pads of both front limbs.

RADIOGRAPHIC DIAGNOSIS

- Soft tissue swelling dorsal aspect level with left third metacarpal bone and very mild periosteal new bone formation

AGE

8 Years, 2 Months

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The radiographic changes are fitting the history, but the swelling is not specific and can be inflammatory or neoplastic in origin. The mild periosteal new bone formation is considered secondary reactive. If not done so yet, FNA sampling of the swelling is mandatory for further evaluation.
