

**PATIENT**

Ryleigh Robertson

**PRESENTING CLINICAL SIGNS**

acute vomiting , lethargic , not eating , he was on Simplicife and Steroid for the last 2 weeks to try a 2 lumps on the right paw

**SPECIES**

Canine

Abnormal PE/Chem/CBC/UA Results: Moderate abdominal discomfort at the let side of the abdomen , he had 2 lumps on the back paw did not respond to the meds , Bloodwork indicated neutrophilia , lymphocytosis , dehydration (High RBCS, HGB , HCT) ,sever elevation of ALP and mild elevation of ALT , GGT, phosph., rest are WNL including CPLI.,

**BREED**

Rottweiler Mix

**RADIOGRAPHIC STUDY OF THE ABDOMEN**

Radiographs of the abdomen in two imaging planes are provided for review.

**SEX**

Female Spayed

**RADIOGRAPHIC FINDINGS**

The surrounding bony structures are within normal limits.

**AGE**

5 Years

No abnormalities of the extraabdominal soft tissues are noted. The abdominal wall is smooth and thin.

The serosal detail is maintained throughout the peritoneal and retroperitoneal space.

The liver is appropriate in position, size and presents uniform opacity.

The splenic head is in the anticipated position and within normal limits for size and opacity. The splenic body and tail are considered normal for position, size, shape and opacity.

Both kidneys are seen and present with normal size, shape, delineation and opacity. The urinary bladder is in its anticipated position. No radiopaque calculi are noted throughout the upper and lower urinary tract.

The stomach is in its anticipated position and is empty.

The small intestinal loops are of even diameter and non-dilated, a small amount of gas is seen within the small intestinal loops and considered within normal limits.

The colon is seen in the expected position and contains a small amount of fecal material.

**RADIOGRAPHIC DIAGNOSIS**

- Empty gastrointestinal tract

**INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS**

The radiographic study presents without abnormalities, explaining the presenting clinical signs. There is no evidence of radiopaque foreign material or signs for gastrointestinal mechanical obstruction. The presumptive diagnosis is gastroenteritis. If clinical signs are refractory to therapy, recommend follow up radiographs or a complete abdominal ultrasound examination; in some cases a high ileus may lack classical radiographic signs of mechanical obstruction.
