PRESENTING CLINICAL SIGNS

E/D is ok No S/C/V On Friday the mass under LF leg pooped and O says that P is uncomfortable No other issues or concerns BAR, m.m-pink, CRT<2sec, EENT, H/L, Abdo, U/G, skin and coat-very large subcut mass on L axilla bottom necrosis with mild bleeding, small hard subcut mass caudal to large mass, BC 8/9
Abnormal PE/Chem/CBC/UA Results:

SPECIES

Canine

RADIOGRAPHIC STUDY OF THE THORAX & ABDOMEN

BREED

A complete set of radiographs of the thorax and abdomen is provided for review.

Mixed

RADIOGRAPHIC FINDINGS

The body condition score is 9/9.

SEX

Thorax

FS

The surrounding bony structures are within normal limits.

AGE

14 Years

An ill-defined soft tissue swelling is seen at the left caudal axillary region/cranioventral left thoracic wall.

INTERPRETED BY

Sebastian Schaub, DVM
Dr. med. vet. DipECVDI

The heart is of normal size and shape, there is no evidence of cardiac chamber or vascular enlargement. The pulmonary vasculature is within normal limits.

The mediastinum is moderately widened by fat.

The trachea is normal in diameter and presents the anticipated course. The luminal outline of the trachea is smooth.

HOSPITAL NAME

Animal Paradise
Hospital

The bronchial tree presents with thin walls and tapers uniformly towards the periphery as expected.

The lung parenchyma presents a generalized increased radiopacity, due to the nutritional status; the intrapulmonary vascular branching is seen up to the third order lung vessels.

REFERRING VET

Dr. Elshafie

The diaphragm is well delineated with even surface and the expected mild cranial bulging of the diaphragmatic cupola.

Abdomen

INVOICE

47129

The surrounding bony structures are within normal limits.

No abnormalities of the extraabdominal soft tissues are noted. The abdominal wall is smooth and thin.

DATE

8-25-21

The serosal detail is maintained throughout the peritoneal and retroperitoneal space.

The hepatic volume is mild to moderately increased and the caudoventral margins are rounded.

**PATIENT**

Kylie Hadzovic

The splenic head is in the anticipated position and within normal limits for size and opacity. The splenic body and tail are considered normal for position, size, shape and opacity.

SPECIES

Canine

Both kidneys are seen and present with normal size, shape, delineation and opacity. The urinary bladder is in its anticipated position. No radiopaque calculi are noted throughout the upper and lower urinary tract.

BREED

Mixed

The stomach is in its anticipated position and presents normal content.

The small intestinal loops are of even diameter and non-dilated, a small amount of gas is seen within the small intestinal loops and considered within normal limits.

The colon is seen in the expected position and presents with appropriate content.

RADIOGRAPHIC DIAGNOSIS**SEX**

FS

- Obesity
- Ill-defined soft tissue swelling/mass caudal aspect left axillary region/cranial thoracic wall
- Hepatomegaly
- No evidence of pulmonary metastatic disease
- Normal abdomen

AGE

14 Years

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS**INTERPRETED BY**

Sebastian Schaub, DVM
Dr. med. vet. DipECVDI

The swelling in the region of the left front limb is fitting the history of a soft tissue mass in this region and neoplasia is considered likely. Potentials for the hepatomegaly include metabolic hepatic disease – considered most likely here –, hepatitis or diffuse neoplastic infiltration. Recommend ultrasound guided FNA sampling for further differentiation.

HOSPITAL NAME

Animal Paradise
Hospital

If surgery of the left axillary mass is an option, cross-sectional imaging might be beneficial for surgical planning.
