

**PATIENT PRESENTING CLINICAL SIGNS**

Fawn Santoro Acute hind limb alternating lameness and paresis, no pain elicited on palpation, normal range of motion hips and stifles, history of RH hip pain  
Abnormal PE/Chem/CBC/UA Results: pending

**SPECIES RADIOGRAPHIC STUDY OF THE ABDOMEN & PELVIS**

Canine Radiographs of the abdomen in three imaging planes are provided for review.

**BREED RADIOGRAPHIC FINDINGS**

Terrier Mix THE LAST RIB BEARING VERTEBRA IS COUNTED AS T13.

The intervertebral disc space T11/T12 is moderately narrowed. The osseous and surrounding soft tissue structures of the lumbar spine present no abnormalities.

**SEX** The osseous and surrounding soft tissue structures of the pelvis are within normal limits. Both coxofemoral joints present smooth osseous margins and congruent joint spaces.

FS No abnormalities of the extraabdominal soft tissues are noted. The abdominal wall is smooth and thin.

**AGE** The serosal detail is maintained throughout the peritoneal and retroperitoneal space.

14.5 Years The hepatic volume is moderately increased, and the liver is protruding caudally beyond the costal arch. The caudoventral hepatic margins are rounded.

**INTERPRETED BY**

Sebastian Schaub, DVM  
Dr. med. vet. DipECVDI

The splenic head is in the anticipated position and within normal limits for size and opacity. The splenic body and tail are considered normal for position, size, shape and opacity.

Both kidneys are seen and present with normal size, shape, delineation and opacity. The urinary bladder is in its anticipated position. No radiopaque calculi are noted throughout the upper and lower urinary tract.

**HOSPITAL NAME**

Boca Park Animal Hospital

The stomach is in its anticipated position and presents normal content.

The small intestinal loops are of even diameter and non-dilated, a small amount of gas is seen within the small intestinal loops and considered within normal limits.

**REFERRING VET**

Laura Warren

The colon is seen in the expected position and presents with appropriate content.

**RADIOGRAPHIC DIAGNOSIS**

- Discopathy T11/T12
- Hepatomegaly
- Normal lumbar spine
- Normal pelvis

**INVOICE**

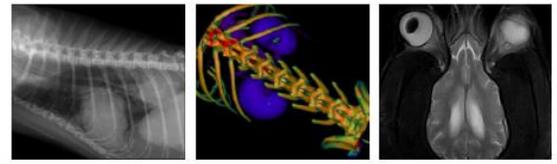

53739

**INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS**

**DATE**

8-25-22

The collapsed intervertebral disc space T11/T12 is suggestive for discopathy that might be associated with compressive myelopathy and secondary neurological deficits. No additional abnormalities are appreciated, explaining the described clinical signs. In case of strong suspicion for compressive myelopathy, cross-sectional imaging is recommended for further workup.

**PATIENT**

Fawn Santoro

Potentials for the hepatomegaly include metabolic hepatic disease/steroid induced hepatopathy, hepatitis or neoplastic infiltration. Ultrasound including FNA sampling can be used as minimally advanced diagnostic tests.
