

PATIENT

Miska Nipp

PRESENTING CLINICAL SIGNS

Pre-screen for mass on left chest, owner noticed about a month ago and started to grow in size and become ulcerated. Mass removed after CT and sent out for biopsy

SPECIES

Canine

COMPUTED TOMOGRAPHY OF THE THORAX

A high resolution pre- and post-contrast CT study of the thorax is provided for review.

BREED

Siberian Husky

COMPUTED TOMOGRAPHIC FINDINGS

Cranial to the left axillary region, a cutaneous, uniform soft tissue attenuating and heterogeneous contrast enhancing mass is seen, presenting a crater like depression of the surface. The cutaneous mass is measuring 2.4 x 3.1 x 2.7 cm in size. The surrounding subcutaneous fat presents moderate fat-stranding and multiple small tortuous vessels are coursing to the mass.

SEX

Female Spayed

The left superficial cervical lymph nodes is prominent.

The sternal, cranial mediastinal and tracheobronchial lymph nodes are small elongated with a normal short-to-long-axis-ratio is < 0.5, the attenuation and contrast enhancement pattern is uniform and considered within normal limits.

AGE

3 Years, 4 Months

The cardiovascular structures including the pulmonary vasculature are within normal limits.

The bronchial tree presents with regular branching and tapers uniformly towards the periphery as expected, the bronchial walls are thin and smooth. The bronchus-to-artery ratio is within normal limits.

INTERPRETED BY

Sebastian Schaub, DVM
Dr. med. vet. DipECVDI

The lung parenchyma presents the expected architecture and attenuation behavior, with randomly distributed interspersed punctuate mineralization.

Small incidental gas pockets are seen within the esophageal lumen, there is no evidence of abnormal dilation.

HOSPITAL NAME

Catskill Veterinary Services, PLLC

COMPUTED TOMOGRAPHIC DIAGNOSIS

- Ulcerated cutaneous soft tissue mass cranial to left axillary region with ill-defined margins
- Mild lymphadenopathy left superficial cervical lymph node
- Pulmonary osteomas
- No evidence of pulmonary metastatic disease

REFERRING VET

Dr Sara Wright

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

INVOICE

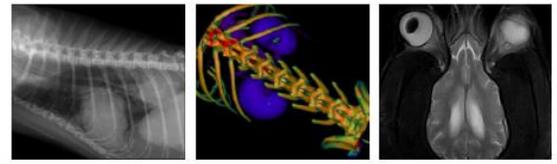

53746

The CT study is fitting the history of an ulcerated mass cranial to the left axillary region – sarcoma or carcinoma are considered likely here. The margins of the mass are ill-defined and should be tried to hold margins of 3 cm.

DATE

8-25-22

The prominent left superficial cervical lymph node is equivocal for reactive hyperplasia or metastatic disease – recommend FNA sampling for further differentiation.
