

**PATIENT**

Pepe Ko

**PRESENTING CLINICAL SIGNS**

Had surgery ~3 months ago in Korea for patellar luxation. Not able to bear weight on R hind leg after falling from couch a few days ago. Visible bruising.

**SPECIES**

Canine

**RADIOGRAPHIC STUDY OF THE RIGHT STIFLE JOINT**

Radiographs of the right stifle joint in multiple imaging planes are provided for review.

**BREED**

Toy Poodle

**RADIOGRAPHIC FINDINGS**

The volume of the musculature of the right hind limb is moderately decreased.

The periarticular bones of the right stifle joint present mild osteophyte new bone formation. The patella is in situ. Two surgical pins are seen running in a craniocaudal direction in the proximal tibia. Distal to the pins in the proximal right tibia, an irregular transverse fracture line is noted in the most proximal aspect of the right tibia. Mild proximal and medial deviation of the distal segment of the tibia is appreciated. The fibula is intact.

**SEX**

Neutered Male

**RADIOGRAPHIC DIAGNOSIS**

- Subacute traumatic transverse proximal diaphyseal fracture right tibia
- History of surgical management of medial patellar luxation by tibial tuberosity transposition
- Disuse atrophy musculature right hind limb

**AGE**

4 Years

**INTERPRETED BY**

Sebastian Schaub, DVM  
Dr. med. vet. DipECVDI

**INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS**

The radiographic study is consistent with proximal transverse diaphyseal fracture of the right tibia - the intact fibula is preventing more pronounced dislocation of the tibia. Surgical management is indicated.
