

PATIENT PRESENTING CLINICAL SIGNS

Lilly Hadley limping intermittently on both front legs. Has been occurring for several months.

RADIOGRAPHIC STUDY OF THE FRONT LIMBS

SPECIES A complete set of radiographs of the front limbs is provided for review.

Canine **RADIOGRAPHIC FINDINGS**

Both shoulder joints present smooth osseous margins and the surrounding soft tissue structures are within normal limits.

BREED

Collie The elbow joints have smooth osseous margins of the periarticular bones, the contour of the medial coronoid process has a homogeneous density and is well-defined. The surrounding soft tissue structures are within normal limits.

SEX The osseous and surrounding soft tissue structures of the carpal joints are within normal limits.

FS Level with the metacarpophalangeal joint of the fifth phalanx, a homogeneous, moderate soft tissue swelling is appreciated. The remainder of the osseous and soft tissue structures of the front paws are within normal limits.

AGE RADIOGRAPHIC DIAGNOSIS

- 7 Years
- Articular swelling metacarpophalangeal joint fifth phalanx right front limb
 - Normal shoulder joints
 - Normal elbow joints

INTERPRETED BY

Sebastian Schaub, DVM
Dr. med. vet. DipECVDI

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

HOSPITAL NAME

The articular swelling of the metacarpophalangeal joint of the fifth phalanx can be a sequela to trauma, degenerative joint disease or arthritis, there are no signs for biologically aggressive disease. Check if pain can be elicited by manipulation of the respective joint.

Barry Magill

No additional abnormalities of the front limbs are appreciated.
