

PATIENT

Bowser Raicevic

PRESENTING CLINICAL SIGNS

coughing with foamy discharge since 3 days ago
 Abnormal PE/Chem/CBC/UA Results: coughing a productive cough , foamy discharge , crackles at the cranial lung lobes area, blood work moderate neutrophilia , elevated ALP , rest is okay.

SPECIES

Canine

RADIOGRAPHIC STUDY OF THE THORAX

Radiographs of the thorax in two imaging planes are provided for review.

BREED

Bulldog

RADIOGRAPHIC FINDINGS

T8 presents as hemivertebra.

The extrathoracic soft tissues present homogeneous without abnormalities.

SEX

Male

The heart is of normal size and shape, there is no evidence of cardiac chamber or vascular enlargement. The pulmonary vasculature is within normal limits.

The cranial mediastinum is prominent – suspect due to thymus.

AGE

7 Months

The esophagus is moderately dilated by gas.

The diameter of the trachea is moderately decreased. Level with the cranial thoracic aperture, the trachea has a generalized increased soft tissue opacity – likely due to superimposed front limbs.

INTERPRETED BY

Sebastian Schaub, DVM
 Dr. med. vet. DipECVDI

Generalized moderate peribronchial cuffing is appreciated. The lung parenchyma presents a mild to moderate ground glass opacity. The lung parenchyma presents with a generalized mild to moderate ground-glass opacity.

The diaphragm is well delineated with even surface and the expected mild cranial bulging of the diaphragmatic cupola.

HOSPITAL NAME

Lakeshore Woods
 Animal Hospital

RADIOGRAPHIC DIAGNOSIS

- Broncho-interstitial lung pattern
- Increased tracheal soft tissue opacity level with cranial thoracic aperture
- Megaesophagus
- Suspect mild tracheal hypoplasia
- Hemivertebra T8

REFERRING VET

Dr. Sam Masoud

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

INVOICE

53299

The lung pattern is suggestive for active bronchopneumonitis– bacterial, parasitic or less likely viral, protozoal. The soft tissue opacification of the trachea is likely a sequela to the superimposed front limbs, however edema of the tracheal wall or exudate within the trachea are considerations.

DATE

8-4-22

The megaesophagus can be a sequela to aerophagia or esophagitis. Check if there is a history of dysphagia.
