

PATIENT PRESENTING CLINICAL SIGNS

Willow Atkinson

Last week Willow came in because she wasn't eating, she was vomiting and crying out when she is picked up. She seemed lethargic and just slept most of the day. She vomited up some clear liquid last week and has been snoring and sneezing. Recommended doing lab work, x-rays and ultrasound but Linda decided to just go with the Cerena injection and Cerenia to go home. Tim says that since Friday, Willow doesn't seem to be better or worse and she is still sensitive in the stomach. Tim said that he's able to hand feed her and she is eating. He hasn't noticed any vomiting or diarrhea since last week. Tim said that 7-10 days ago, he went outside and saw Willow eating a critter, he wasn't able to tell what kind of critter it was. He also said that Willow has a wheeze, he was unsure if it was actually a snore or not.

RADIOGRAPHIC STUDY OF THE ABDOMEN

Radiographs of the abdomen in three imaging planes are provided for review.

SEX
RADIOGRAPHIC FINDINGS

Spayed Female

The surrounding bony structures are within normal limits.

AGE

No abnormalities of the extraabdominal soft tissues are noted. The abdominal wall is smooth and thin. The serosal detail is maintained throughout the peritoneal and retroperitoneal space.

1 Year 11 Months

The liver is appropriate in position, size and presents uniform opacity.

INTERPRETED BY

 Sebastian Schaub,
 DVM Dr. med. vet.
 DipECVDI

The splenic head is in the anticipated position and within normal limits for size and opacity. The splenic body and tail are considered normal for position, size, shape and opacity.

Both kidneys are seen and present with normal size, shape, delineation and opacity. The urinary bladder is in its anticipated position. No radiopaque calculi are noted throughout the upper and lower urinary tract.

HOSPITAL NAME

Elizabeth AH

The stomach is in its anticipated position and contains a small amount of foamy soft tissue material. The small intestinal loops are of even diameter and non-dilated, a small amount of gas and foamy material is seen within the small intestinal loops.

The colon is seen in the expected position and presents with appropriate content.

REFERRING VET

Dr. Leon Anderson

RADIOGRAPHIC DIAGNOSIS

- Mild alimentary pattern gastrointestinal tract

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The radiographic study of the abdomen presents without abnormalities that can explain the history of vomiting. There is no evidence of radiopaque foreign material, abnormal gas pattern or signs for gastrointestinal mechanical obstruction. If clinical signs are refractory to therapy, recommend follow up radiographs or a complete abdominal ultrasound examination; in some cases, a high ileus may lack classical radiographic signs of mechanical obstruction.

PATIENT

Willow Atkinson

The information and recommendations provided are based on the images presented by the referring veterinarian. No evaluation can be communicated regarding pathology that was not visible in the image/video clips provided.
