

**PATIENT PRESENTING CLINICAL SIGNS**

**Bubba Tex Glass** History: Hx of falling down a step a couple of weeks ago. P was limping on a front leg after accident, but o doesn't remember which leg. O noticed swollen paw a couple of days ago, but no lameness reported. history of early CHF.

**SPECIES**

Canine

Abnormal PE/Chem/CBC/UA Results: P2 of digit 2 on RF foot circumferentially swollen. Favoring RFL. Slight carpal varus and toes appeared splayed/flattened when bearing weight. No signs of external trauma and nail intact. No pain response with digital pressure to swelling.

**BREED**

Chihuahua

**RADIOGRAPHIC STUDY OF THE FRONT PAWS**

A dorsopalmar projection of both front paws is provided for review.

**RADIOGRAPHIC FINDINGS**

**SEX**

Neutered Male

The second phalanx of the right front paw, level with the distal interphalangeal joint, presents mild granular mineralization of the periarticular soft tissues with an associated moderate periarticular swelling. No abnormalities of the osseous structures of the distal second phalanx are noted. Evaluation of the middle phalanx of the second digit is limited by the oblique projection.

**AGE**

14 Years

**RADIOGRAPHIC DIAGNOSIS**

- Soft tissue swelling second digit right front limb with mild dystrophic mineralization

**INTERPRETED BY**

Sebastian Schaub,  
DVM Dr. med. vet.  
DipECVDI

**INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS**

The findings of the second digit are equivocal for chronic (preceding) inflammation with dystrophic mineralization, calcinosis circumscripta or periarticular mineralizing neoplasia (no overt signs for osteolysis). Recommend FNA sampling for further definition. As there is no associated pain, pending the findings of the advanced diagnostic test, follow up radiographs in 3-4 weeks would be beneficial to screen if the changes are stationary or progressive.
