

PATIENT PRESENTING CLINICAL SIGNS

PATIENT

Lucky Adams
History: injured Right front playing with housemate over the weekend. Lucky was non-weight bearing for a few days. Lucky was able to put weight on the par today. (9/21)

SPECIES
Abnormal PE/Chem/CBC/UA Results: PAINFUL TO MANIPULATION OF LEFT FRONT ELBOW, EXTENSION AND FLEXION, CREPITUS AS WELL. Kidney panel was ran- looks good.

Canine

RADIOGRAPHIC STUDY OF THE ELBOW AND CARPAL JOINTS

BREED

Mediolateral projections - neutral and flexed elbow joints - of the antebrachium bilaterally are provided for review.

Labrador Retriever
Mix

RADIOGRAPHIC FINDINGS

The osseous and surrounding soft tissue structures of the antebrachium bilaterally are within normal limits. The osseous margins of the elbow and carpal joint are smooth.

SEX

RADIOGRAPHIC DIAGNOSIS

Male

- Normal antebrachium bilaterally

AGE

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

8 Months 3 Weeks

There is no evidence of pathology of the osseous structures and the presumptive diagnosis is contusion. If clinical signs are refractory to therapy or there is suspicion for physeal trauma (less likely as growth plates have ready begun to close), follow up radiographs in 2 weeks in two orthogonal imaging planes are recommended.

INTERPRETED BY

The information and recommendations provided are based on the images presented by the referring veterinarian. No evaluation can be communicated regarding pathology that was not visible in the image/video clips provided.

Sebastian Schaub,
DVM Dr. med. vet.
DipECVDI

Thank you for this referral. If the clinical or image interpretation does not parallel your findings or if I can be of any further assistance please contact me.
