

**PATIENT PRESENTING CLINICAL SIGNS**

Luna Leaser Bilateral epistaxis, culture done.

COMPUTED TOMOGRAPHY OF THE SKULL

SPECIES A high resolution pre- and post-contrast CT study of the skull is provided for review.

Canine **COMPUTED TOMOGRAPHIC FINDINGS**

Triadan 306&406 are absent. A supernumerary triadan 305 is appreciated.

BREED In both nasal cavities, a mild to moderate amount of fluid attenuating material is attached to a mildly thickened nasal mucosal lining.

Lab Mix Both temporomandibular joints present congruent joint spaces with even subchondral bone surfaces and are considered within normal limits.

SEX Both tympanic bullae are aerated, the mucosal lining is not seen, the bony wall is smooth and thin. The external ear canals are within normal limits.

Spayed Female

AGE The brain presents no deviation from normal anatomy and symmetry. The brain parenchyma is homogeneous and within normal limits for attenuation and distribution of contrast enhancement. The ventricular system is non-dilated and symmetric.

5 Years The submandibular and medial retropharyngeal lymph nodes are small and elongated with a normal short-to-long-axis-ratio is < 0.5, the attenuation and contrast enhancement pattern is uniform.

COMPUTED TOMOGRAPHIC DIAGNOSIS**INTERPRETED BY**

- Exudate in nasal cavity with mild mucosal thickening

Sebastian Schaub, DVM
Dr. med. vet. DipECVDI

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS**HOSPITAL NAME**

There is no evidence for neoplastic disease of the nasal cavity or foreign body related rhinitis. Possible causes for epistaxis include immune mediated disease, non-specific rhinitis (e.g. lymphocytic plasmocytic), hyperviscosity syndrome (e.g. Leishmaniosis), other causes for coagulopathy or systemic hypertension.
