

### PRESENTING CLINICAL SIGNS

#### PATIENT

Xiaobai Jiang  
History: vomiting for 2 days  
Abnormal PE/Chem/CBC/UA Results: bloodwork is unremarkable

### SPECIES RADIOGRAPHIC STUDY OF THE ABDOMEN

Canine A complete set of radiographs of the abdomen is provided for review.

### RADIOGRAPHIC FINDINGS

#### BREED

Lab Retriever  
A thin sclerotic rim is seen level with the transition between the femoral head and neck.  
No abnormalities of the extraabdominal soft tissues are noted. The abdominal wall is smooth and thin. The serosal detail is maintained throughout the peritoneal and retroperitoneal space.

#### SEX

Neutered Male  
The liver is appropriate in position, size and presents uniform opacity.

The splenic head is in the anticipated position and within normal limits for size and opacity. The splenic body and tail are considered normal for position, size, shape and opacity.

#### AGE

24 Months  
Both kidneys are seen and present with normal size, shape, delineation and opacity. The urinary bladder is in its anticipated position. No radiopaque calculi are noted throughout the upper and lower urinary tract.

The stomach is in its anticipated position and contains a mild amount of fluid and gas.

### INTERPRETED BY

Sebastian Schaub,  
DVM Dr. med. vet.  
DipECVDI

The small intestinal loops are of even diameter and non-dilated, a small amount of gas is seen within the small intestinal loops and considered within normal limits.

The colon is seen in the expected position and contains a mild to moderate amount of gas and fecal material.

### RADIOGRAPHIC DIAGNOSIS

#### HOSPITAL NAME

St.Catharine's AH

- Overall empty gastrointestinal tract

### INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

#### REFERRING VET

Dr. Boctor

There is no evidence of radiopaque foreign material or signs for gastrointestinal mechanical obstruction and the presumptive diagnosis is gastritis. Recommend empirical management. If clinical signs are refractory to therapy, follow up radiographs or a complete abdominal ultrasound examination are recommended; in some cases a high ileus can lack classical radiographic signs for mechanical obstruction.
