RADIOGRAPHIC STUDY OF THE NECK AND THORAX

BREED

Golden Retriever Radiographs of the neck and thorax in two imaging planes are provided for review.

RADIOGRAPHIC FINDINGS

SEX

Neck

Spayed Female No overt abnormalities of osseous and soft tissue structures of the neck are noted but multiple cutaneous fold.

AGE

Thorax

12 Years 9 Months Multifocal mild spondylosis formation is noted along the thoracic spine.

INTERPRETED BY

The extrathoracic soft tissues present homogeneous without abnormalities.

Sebastian Schaub,
DVM Dr. med. vet.
DipECVDI

The heart is of normal size and shape, there is no evidence of cardiac chamber or vascular enlargement. The pulmonary vasculature is within normal limits.

HOSPITAL NAME

The cranial mediastinum presents the expected soft tissue opacity. The mediastinal width is less than twice the width of the vertebral column at the same level.

DPC Veterinary H

The trachea is normal in diameter and presents the anticipated course. The luminal outline of the trachea is smooth.

REFERRING VET

Dr. Feldt

The bronchial tree presents with thin walls and tapers uniformly towards the periphery as expected. The lung parenchyma presents the expected architecture and opacity; the intrapulmonary vascular branching is seen up to the third order lung vessels.

INVOICE

13360

The diaphragm is well delineated with even surface and the expected mild cranial bulging of the diaphragmatic cupola.

RADIOGRAPHIC DIAGNOSIS

- Spondylosis deformans thoracic spine

DATE

9/29/21

PATIENT

- No evidence of pulmonary metastatic disease
- Normal neck

Honey Saravia
