RADIOGRAPHIC STUDY OF THE THORAX

Radiographs of the thorax in three imaging planes are provided for review.

BREED

RADIOGRAPHIC FINDINGS

DSH

Moderate spondylosis formation is present along the caudal thoracic spine and level C6/C7.

SEX

The extrathoracic soft tissues present homogeneous without abnormalities.

Neutered Male

The heart is of normal size and shape, there is no evidence of cardiac chamber or vascular enlargement. The pericardium contains a moderate amount of fat. The pulmonary vasculature is within normal limits.

AGE

The cranial mediastinum presents the expected soft tissue opacity. The mediastinal width is less than twice the width of the vertebral column at the same level.

8 Years

The trachea is normal in diameter and presents the anticipated course. The luminal outline of the trachea is smooth.

The bronchial tree presents with thin walls and tapers uniformly towards the periphery as expected.

INTERPRETED BY

The lung parenchyma presents the expected architecture and opacity; the intrapulmonary vascular branching is seen up to the third order lung vessels.

Sebastian Schaub,
DVM Dr. med. vet.
DipECVDI

The diaphragm is well delineated with even surface and the expected mild cranial bulging of the diaphragmatic cupola.

HOSPITAL NAME

RADIOGRAPHIC DIAGNOSIS

St. Catharine's AH

- Spondylosis deformans

REFERRING VET

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Dr. Masoud

The radiographic study presents no clinically relevant pathology, but mild degenerative changes of the spine. To rule out cardiac pathology completely, a cardiac echo can be considered.

INVOICE

13369

The information and recommendations provided are based on the images presented by the referring veterinarian. No evaluation can be communicated regarding pathology that was not visible in the image/video clips provided.
