

**PATIENT**

Delilah Pereira

**PRESENTING CLINICAL SIGNS**

Acute onset right hindlimb lameness, toe touching - started 9 days ago. Grade 2 MPL bilateral. Possible pain response on palpation of proximal tibia. No response to carprofen

**SPECIES**

K9

**RADIOGRAPHIC STUDY OF THE PELVIS AND STIFLE JOINTS**

A complete set of radiographs of the pelvis and the stifle joints is provided for review.

**BREED**

Mixed

The growth plates are age related open.

The osseous and surrounding soft tissue structures of the pelvis are within normal limits. Both coxofemoral joints present smooth osseous margins and congruent joint spaces.

**SEX**

F

The volume of the right thigh musculature is mild to moderately decreased in comparison to the contralateral limb.

Both stifle joints present smooth osseous margins and without evidence of intracapsular swelling.

**AGE**

22 Weeks

**RADIOGRAPHIC DIAGNOSIS**

- Disuse atrophy right thigh musculature

**INTERPRETED BY**

Sebastian Schaub, DVM  
Dr. med. vet. DipECVDI

**INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS**

The radiographic study of the hind limbs presents without abnormalities, explaining the hind limb lameness, but the secondary disuse atrophy of the musculature of the right hind limb. I do not see evidence of trauma to the growth plates signs of fracture or soft tissue swelling indicating inflammation.
