

**PRESENTING CLINICAL SIGNS****PATIENT**

Xeno Foster

History: Previously healthy, 2 day progressive focal/autonomic cluster seizures. normal exam between.

SPECIES

Feline

MAGNETIC RESONANCE IMAGING OF THE SKULL

T2 weighted, FLAIR, diffusion weighted, SWI, T1 pre- and post-gadolinium sequence in multiple imaging planes are provided for review.

BREED

DSH

MAGNETIC RESONANCE IMAGING FINDINGS**Head**

The brain presents the expected anatomy and bilateral symmetry with normal signal intensity and contrast enhancement. There is no evidence of abnormal meningeal enhancement.

SEX

Neutered Male

The ventricular system presents the expected dimensions, morphology and the CSF signal is within normal limits in all sequences.

AGE

5 Years

The tympanic bullae are aerated and the bony lining is thin.

Surrounding soft tissue structures in the head region are within normal limits.

MAGNETIC RESONANCE IMAGING DIAGNOSIS

- Normal brain

INTERPRETED BY

Sebastian Schaub,
DVM Dr. med. vet.
DipECVDI

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

In the present study of the brain there is no evidence of macromorphological disease.

HOSPITAL NAME

Animal Health
Partners

If not yet done so the workup should be complemented by examination of CSF and complete bloodwork to screen for brain disease that is not necessarily associated with structural changes of the brain parenchyma and rule out hepatoencephalopathy and other systemic illness. Intoxication should be ruled out as potential source for the seizure activity as well.

REFERRING VET

Dr. Stephanie Lovell

The information and recommendations provided are based on the images presented by the referring veterinarian/sonographer. No evaluation can be communicated regarding pathology that was not visible in the image/video clips provided.

Thank you for this referral. If the clinical or image interpretation does not parallel your findings or if I can be of any further assistance please contact me.
