

PRESENTING CLINICAL SIGNS

PATIENT

Otis Teles

History: Started limping two weeks ago on the right hind leg, the limping has improved with the metacam but sometimes after exercise he will not put weight on the limping leg

SPECIES

Canine

Abnormal PE/Chem/CBC/UA Results: two weeks ago, there was pain on extending the right hock joint

RADIOGRAPHIC STUDY OF THE LUMBAR SPINE, PELVIS AND HIND LIMBS

A complete set of radiographs of the lumbar spine, pelvis and hind limbs is provided for review.

BREED

American Bulldog

RADIOGRAPHIC FINDINGS

The growth plates are age related open.

SEX

Neutered Male

The osseous and surrounding soft tissue structures of the lumbar spine are within normal limits.

The pelvis presents without abnormalities. The coxofemoral joints have a congruent joint space and the periarticular bones present smooth osseous margins.

AGE

11 Months

Both stifle joints present regular smooth margins of the periarticular bones without evidence of intracapsular soft tissue swelling.

The tarsal joints are unremarkable.

RADIOGRAPHIC DIAGNOSIS

INTERPRETED BY

Sebastian Schaub,
DVM Dr. med. vet.
DipECVDI

- Normal lumbar spine
- Normal pelvis & coxofemoral joints (no signs for dysplasia)
- Normal stifle joints bilaterally
- Normal tarsal joints bilaterally

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

HOSPITAL NAME

Truscott AH

The radiographic study presents without abnormalities, explaining the right hind limb lameness, there is no evidence of articular swelling along the hind limbs. Consider radiographs of the tarsal joints in a dorsoplantar projection if there is strong clinical suspicion for osseous abnormalities.

REFERRING VET

Dr. Erini Abraham

The information and recommendations provided are based on the images presented by the referring veterinarian. No evaluation can be communicated regarding pathology that was not visible in the image/video clips provided.
