PRESENTING CLINICAL SIGNS

History:

- Vomiting and Lethargic.
- Will vomit her entire meal, undigested with a lot of clear liquid.
- A week ago she came in with a bird feather in her mouth, the other dog vomited up the bird.
- Eats a lot of deer poop.
- First time she vomited there was a little black something, about mouse size, possibly part of a sock. Still wants to eat. Unsure of last bowel movement.
- Laying around more.
- Bad gas and burping a lot.
- History of eating a silicone BBQ brush that had to be removed

Abnormal PE/Chem/CBC/UA Results: PE: Behavior/Mentation: inactive but alert Hydration: Dehydrated Ears: Bilateral moderate inflammation and moist brown exudate AU Musculoskeletal: Advanced arthritis in both carpi Chem/CBC MCHC 31.5 g/dL, 32-37.9 g/dL WBC 3.72 K/ μ L, 5.05-16.76 K/ μ L Neutrophils 1.41 K/ μ L, 2.95-11.64 K/ μ L PDW 8.9, 9.1-19.4 fL Potassium, 6.5 mmol/L, 3.5-6.8 mmol/L

RADIOGRAPHIC STUDY OF ABDOMEN

Orthogonal radiographic views of the abdomen are provided for review, totaling eight images, including right and left lateral projections and ventrodorsal views.

RADIOGRAPHIC FINDINGS

The stomach is not distended and contains a small amount of gas admixed with homogeneous soft tissue/fluid opacity, which redistributes with patient positioning. There is no evidence of gastric dilation or rotation.

The small intestines are normally distributed, of normal diameter, contain a moderate amount of gas, and mildly homogeneous soft tissue fluid material. No evidence of punching or plication.

No evidence of radiopaque gastrointestinal foreign material or mechanical obstruction.

The descending colon is predominantly gas-filled, with a small amount of heterogeneous soft tissue/fluid opaque fecal material.

The liver and spleen are normal in size, shape, and contour.

The renal silhouettes are partially visualized and appear within normal radiographic limits.

The urinary bladder is moderately filled with homogeneous soft tissue material.

The uterus and ovaries are not applicable.

Serosal detail is normal. No abdominal mass effect is identified.

An incidental incomplete bridging spondylosis deformans is noted at the L1-L2 vertebral level.

RADIOGRAPHIC DIAGNOSIS

- No radiographic abnormalities are identified in the abdomen.
- No evidence of gastric dilatation or volvulus.
- No radiographic evidence of mechanical gastrointestinal obstruction, radiopaque foreign material, or indirect signs of linear foreign body.

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The abdominal radiographic examination is within normal limits. There is no radiographic evidence of gastric dilatation or volvulus. Based on the clinical history and absence of obstructive radiographic findings, a non-obstructive gastrointestinal disorder, such as nonspecific gastroenteritis, should be considered as a differential diagnosis.

The information and recommendations provided are based on the images presented by the referring veterinarian. No evaluation can be communicated regarding pathology that was not visible in the image/video clips provided.

Thank you for this referral. If the clinical or image interpretation does not parallel your findings or if I can be of any further assistance, please contact me.
