

## PATIENT

Roscoe Tironi

## SPECIES

Canine

## BREED

Mixed K9

## SEX

MN

## AGE

5

## WEIGHT

88

## INTERPRETED BY

Tilde Rodrigues Froes,  
DMV, MSc., Dr. Med  
Vet., Dipl. CBraRVet

## IMAGING PERFORMED BY

Hamburg Veterinary  
Clinic

## HOSPITAL NAME

Hamburg Veterinary  
Clinic

## REFERRING VET

Dr. Branning

## INVOICE

74629

## DATE

4-16-26

## PRESENTING CLINICAL SIGNS

limping on and off front right since October

## RADIOGRAPHIC STUDY OF THE THORACIC LIMBS (ELBOW JOINTS)

Cranio-caudal projection of both elbows and mediolateral projections of each elbow joint are provided for review. Study quality is adequate for interpretation.

## RADIOGRAPHIC FINDINGS

### Right elbow joint

The humeroradial and humeroulnar joint spaces are preserved and congruent.

The articular margins of the distal humerus, radial head, and proximal ulna are smooth and well-defined.

The medial coronoid process and the anconeal process region are unremarkable on the provided projections.

### Left elbow joint

The humeroradial and humeroulnar joint spaces are preserved and congruent.

The articular margins of the distal humerus, radial head, and proximal ulna are smooth and well-defined.

The medial coronoid process and the anconeal process region are unremarkable on the provided projections.

### Additional structures:

The remaining visualized osseous structures and surrounding soft tissues within the collimated field are unremarkable.

## RADIOGRAPHIC DIAGNOSIS

- No radiographic evidence of elbow joint abnormality.

## INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

No radiographic evidence of elbow joint abnormality to explain the reported intermittent right forelimb lameness.

Consider a soft tissue injury (e.g., strain). Repeat orthopedic examination and musculoskeletal ultrasound are recommended for further evaluation of potential soft tissue lesions.
