74713

DATE

4-21-26

PRESENTING CLINICAL SIGNS

Muffled heart sounds auscultated during physical exam. No clinical history per owner of any changes to regular behavior at home.

RADIOGRAPHIC STUDY OF THE THORAX

Orthogonal views of the thorax are available for review totaling three images. One ventrodorsal view. One right lateral view. One left lateral view.

RADIOGRAPHIC FINDINGS

The trachea is normal in position and diameter.

The pulmonary parenchyma is normal in opacity and volume of expansion.

The cardiac silhouette is within normal limits in size and shape, occupying approximately 3.0 intercostal spaces on the lateral projection. Vertebral Heart Score (VHS) is 9.8, within normal limits.

The pulmonary vessels are normal in size and distribution.

The pleural space is unremarkable.

The diaphragm, mediastinum, thoracic wall, ribs, and visible osseous structures are within normal limits.

The visible cranial abdomen is unremarkable.

RADIOGRAPHIC DIAGNOSIS

- No radiographic abnormalities identified in the thorax.

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Thoracic radiographs are within normal limits.

Given the reported muffled heart sounds in the absence of radiographic abnormalities, echocardiography may be considered for further evaluation of possible subtle pericardial or pleural effusion not detectable radiographically.
