PRESENTING CLINICAL SIGNS

Was diagnosed with aspiration pneumonia May 6th at the ER, Treated with Amoxi-Clav and Enrofloxacin for two weeks.

Abnormal PE/Chem/CBC/UA Results: BAR, temp normal, Symptoms resolved

RADIOGRAPHIC STUDY OF THE THORAX

Orthogonal views of the thorax are available for review totaling three images. Two ventrodorsal views. One right lateral view.

RADIOGRAPHIC FINDINGS

The pulmonary fields are normally expanded and maintain normal overall pulmonary opacity. No focal alveolar pulmonary opacity is identified. No evidence of pleural effusion or pneumothorax is seen.

A small triangular soft tissue opacity is present within the cranial mediastinum, consistent with a remnant thymic silhouette (physiologic thymus).

The trachea is normal in diameter and position.

The cardiac silhouette and pulmonary vasculature are within normal limits (VHS = 9.8).

The pleural space, diaphragm, thoracic wall, and visible osseous structures are unremarkable.

The esophagus is unremarkable

The included cranial abdomen is within normal limits.

RADIOGRAPHIC DIAGNOSIS

- No radiographic evidence of active pulmonary disease or aspiration pneumonia.
- Small cranial mediastinal soft tissue opacity consistent with a normal remnant thymus.

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Current thoracic radiographs are within normal limits for the patient's age. The small cranial mediastinal triangular opacity is compatible with a physiologic residual thymus in a young dog.

No radiographic evidence of residual or recurrent aspiration pneumonia is identified at this time.
