PRESENTING CLINICAL SIGNS

Had a suspected R carpal injury on May 29th- was treated elsewhere
Follow up radiographs today

RADIOGRAPHIC STUDY OF THE THORACIC LIMBS - CARPI

Three radiographic images of the thoracic limbs were provided for review. One craniocaudal projection of the carpi, and two lateral projections of the right carpus. Only craniocaudal projection of the left carpus were available.

RADIOGRAPHIC FINDINGS

RIGHT

Moderate soft tissue swelling surrounds the distal antebrachium and carpus, appearing predominantly extra-articular.

The antebrachial, carpal, and proximal metacarpal bones are unremarkable.

No radiographic evidence of fracture, osseous remodeling, or other osseous abnormality.

LEFT

No radiographic abnormalities identified on the submitted images.

RADIOGRAPHIC DIAGNOSIS

- Moderate periarticular/extra-articular soft tissue swelling of the right carpus. Differential diagnoses include soft tissue swelling, residual soft tissue injury.
- Radiographic appearance of the left carpus is unremarkable.

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The persistent soft tissue swelling is compatible with active, ongoing healing or residual inflammation following the reported traumatic injury. No radiographic evidence of associated osseous injury is identified.

If clinically significant lameness or carpal instability is present, further evaluation of the soft tissue supporting structures (ligaments, tendons, and joint capsule) with stress radiographs or ultrasonography is recommended.
