

PATIENT PRESENTING CLINICAL SIGNS

Franklin Walther Lameness Left Pelvic limb. Resolved with Carprofen and rest. No palpable abnormalities. Current meds: No current meds

SPECIES RADIOGRAPHIC STUDY OF THE PELVIS AND PELVIC LIMBS

Canine Orthogonal views of the pelvis and pelvic limbs are provided for review, totaling 3 images. One ventrodorsal/craniocaudal view, two lateral view focus on stifle joints.

BREED RADIOGRAPHIC FINDINGS

Corgi The pelvis and coxofemoral joints are normal.
The stifle joints and fat-pad opacity are normal.

SEX Bilaterally, there is mild displacement of the patellae in the craniocaudal view. The patellae are superimposed on the lateral epicondyle of the respective femur. However, the fat pad opacity is normal.

MN The tarsocrural, tarsal and metatarsal joints are normal.

AGE No traumatic acute or aggressive osseous lesions.

3 Years No asymmetric soft tissue swelling identified.

RADIOGRAPHIC DIAGNOSIS

INTERPRETED BY

Tilde Rodrigues Froes, DMV, MSc., Dr. Med Vet., Dipl. CBraRVet

- Mildly dislocated patellae and superimposition with the lateral epicondyle of the respective femur in the craniocaudal view. The differential diagnosis includes a positional artifact. Less likely patellar instability, patellae dynamic subluxation
- The remainder musculoskeletal structures are normal.

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

HOSPITAL NAME

Byram Animal Hospital

No aggressive, acute traumatic, or soft tissue swelling are identified. The patella displacement could be correlated to positional artifact. No clear radiographic signs explain the presented clinical signs in the left pelvic limb. Consider soft tissue sprain or strain injury.
