

**PATIENT PRESENTING CLINICAL SIGNS**

Guiness Cawley History: has a mass in the eye - check for abdominal masses

**SPECIES ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN**

Feline **Urinary System**

**BREED** The urinary bladder is moderately with anechoic urine, and no luminal sediment is present. The ureteral papillae, trigone and pelvic urethra are of normal appearance, and the ureters are not visible (normal). No masses, calculi or mucosal irregularities are noted. Urethra visualized to 3.0 cm.

DSH

**SEX** The kidneys are of normal size and shape and exhibit appropriate corticomedullary differentiation with a normal 1:3 cortex to medulla ratio. There is no evidence of nephrolithiasis, mineralization, pyelectasia, cystic change or hydronephrosis. The proximal ureter is not visible (normal). The left kidney is 4.1 cm in length. The right kidney is 4.6 cm in length.

Neutered Male

**AGE**

15 years

**Adrenal Glands**

**WEIGHT**

The adrenal glands are both identified in their normal locations. They are normal in size and shape with appropriate parenchymal echogenicity and normal phrenic vasculature. The left adrenal gland height is 5.3 mm at the caudal pole. The right adrenal gland height 4.9 mm at the caudal pole.

12 lbs

**Spleen**

**INTERPRETED BY**

The spleen is of appropriate size and has a normal, homogenous parenchyma with a smooth, continuous capsular surface. The splenic vasculature is normal with no evidence of congestion or thrombosis, and blood flow through the splenic hilus appears normal. Thickness at the splenic hilus is normal at 8.6 mm.

DABVP (canine/feline  
practice)

**Liver**

**IMAGING PERFORMED BY**

The liver is of appropriate size and shape, with sharp borders and a mildly coarse parenchymal echotexture that is hypoechoic to the spleen. The portal and hepatic vasculature are of normal size and appearance with no evidence of congestion or thrombosis.

Diane McFadden

The gallbladder is moderately distended with anechoic contents. The wall was thin and continuous with no focal lesions. The cystic and common bile ducts are normal / not visible.

**HOSPITAL NAME**

**Gastrointestinal**

Basking Ridge AH

The stomach is empty. The gastric wall is subjectively normal in thickness, and exhibits appropriate wall layering, but cannot be accurately measured due to normal deviations of the rugal folds. The pylorus is of normal appearance.

**REFERRING VET**

Dr Hollo

The visualized portions of the duodenum, jejunum, and ileum are of normal thickness with intact wall layering that exhibits the appropriate 1:3 muscularis to mucosa ratio. The duodenal wall measures 2.5 mm. The jejunal wall measures up to 2.3 mm. Intestinal motility appears normal.

**INVOICE**

13963

The visible portions of the colon are of normal thickness, up to 1.3 mm, with intact wall layering. The ileocecal junction is visualized and appears normal.

**DATE**

**Pancreas**

8.4.23

The areas of the limbs and body of the pancreas are isoechoic to the surrounding mesenteric fat, with normal capsular appearance. There is no evidence of peripancreatic inflammation. The pancreatic duct appears normal.

**PATIENT** *Free Abdomen*

Guinness Cawley

There is no evidence of free fluid within the peritoneal cavity. The omentum and intra-abdominal fat are of appropriate echogenicity. Enlarged abdominal lymph nodes are not observed. The aortic trifurcation has normal blood flow with no evidence of thrombosis.

**ULTRASONOGRAPHIC FINDINGS**

**Findings**

- Unremarkable geriatric abdomen

**SEX**

Neutered Male

**INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS**

There is no evidence of metastatic disease or other significant illness on today's ultrasound. If not already performed, three-view chest radiographs would also be recommended.
